L4 ANSWER 1 OF 7 CAPLUS COPYRIGHT 2004 ACS on STN
 AB The polyamic acids and polyimides are manufactured by polymerization of
 Z1

tetracarboxylic dianhydride, ≥1 aromatic diamine, ≥1 diamine
 having siloxane units RSiMe₂(OSiMe₂)_nR (R = C₁-20 alkylene; n = 1-20),
 and
 4-R-substituted cyclohexylidene dianiline and/or 3,3,5-
 trimethylcyclohexylidene dianiline (R = Me, Et, CMe₃, CMe₂CH₂CH₃,
 phenyl).

Thus, a solution of a polyamic acid prepared from oxydianiline,
 trimethylcyclohexylidene dianiline,
 bis(3-aminopropyl)tetramethyldisiloxan
 e, and 3,3',4,4'-benzophenonetetracarboxylic acid dianhydride was applied
 on a glass plate, dried, and heated at 300° for 1 h to give a
 polyimide film with T_g 305°, modulus of elasticity 4900 N/mm², and
 tensile strength 105.8 N/mm². An adhesive tape, useful for electronic
 parts, etc., containing a polyimide prepared from the polyamic acid
 showed

improved adhesion at high temp and good solubility in organic solvents.

L4 ANSWER 2 OF 7 CAPLUS COPYRIGHT 2004 ACS on STN
AB Polyamic acid are prepared by reacting a mixture containing: at least one tetracarboxylic dianhydride; at least one aromatic diamine; at least one diamine with a siloxane structure, and at least one alkyl or aryl cyclohexylidene dianiline. The polymers have such three-dimensional mol. structures that a significant improvement can be brought about in solvent solubility, thermal resistance, mech. properties, and adhesive properties onto various substrates. The polyamic acid is converted into polyimide through thermal or chemical imidization. The polyimide is suitable for use in adhesives or adhesive tapes for electronic parts.

 AB A review with 15 refs. is given on the authors preparation of diamine monomers and polymers followed by data on solubility and phys. properties of the polyimides. A series of novel aromatic diamines containing kinked cycloalkane structures between 2 Ph rings were synthesized by HCl-catalyzed condensation reaction of excess aniline and corresponding cycloalkanone deriva. The structures of the diamines were identified by ¹H NMR, ¹³C NMR, FT-IR spectroscopy, and elemental anal. The polyimides were synthesized from the obtained diamines with various aromatic dianhydrides by one-step polymerization in m-cresol. The polymerization was conducted for 6. apprx. 8 h with refluxing, which was enough to obtain the polymers with high mol. weight. The inherent viscosities of the resulting polyimides were in the range of 0.37. apprx. 1.66 dL/g. All polymers were readily soluble in common organic solvents such as chloroform, tetrachloroethane, dimethylacetamide, etc. and the glass transition tempa. were observed at 290-372°. UV-visible spectra were obtained to measure the transparency of polymer films. Most of the polymers showed high transmission above 90% in the wavelength of 450. apprx. 600 nm.

AB Novel poly(amide imide)s (PAI) containing alkyl-substituted cyclohexylidene moieties were synthesized by conventional polycondensation of trimellitic anhydride chloride with novel aromatic diamines followed by chemical imidization using acetic anhydride and pyridine. The inherent viscosities of the resulting PAIs are relatively high and range from 71-112 mL g⁻¹. The prepared PAIs show excellent thermal stability and good solubility. The glass transition temps. (T_g) measured by DSC are observed in the range of 312-342°. Furthermore, all the polymers are readily soluble in less hygroscopic organic solvents like cyclohexanone, λ -butyrolactone as well as aprotic polar solvents.

AB A series of 3 aromatic diamines containing kinked cyclohexylidene moieties was synthesized by condensation of excess PhNH₂ with cyclohexanones containing 0, 1, or 3 Me groups. The structures of the cyclohexylidenedianilines were identified by ¹H NMR, ¹³C NMR, and FT-IR spectroscopies. Polyimides were synthesized from the obtained diamines and various aromatic dianhydrides

by the conventional polycondensation reaction followed by chemical imidization as well as high-temperature one-step polymerization. The inherent viscosities and weight-average mol. wts. of the polyimides were in the ranges of 0.55-1.58 dL/g and (7.4-15.2) × 10⁴ g/mol, resp. The prepared polyimides showed excellent thermal stabilities and good solubility. All polymers were readily soluble in common organic solvents such as THF, chloroform, tetrachloroethane, etc., and the glass transition temps. were observed at 290-372°.

 GI For diagram(s), see printed CA Issue.
 AB The diamines I (R1, R2 = H, Cl, Br, alkyl, cycloalkyl, aryl, aralkyl; R3, R4 = H, alkyl (but ≥ 1 C atom must bear 2 alkyl groups); m = 4-7), useful in polymerization, are prepared Thus, HCl-catalyzed condensation of 11 mol dihydroisophorone with 66 mol PhNH2 at 140° gave 1045 g 4,4'-(3,3,5-trimethylcyclohexylidene)dianiline (II). Mixing 7.7 g II in DMF with a DMF solution of prepolymer from 600 g polypropylene glycol (OH number 112) and 268 g IPDI, casting the solution on glass, and drying at 100-150° gave a film with softening point (DSC) 206°.

L11 ANSWER 1 OF 14 CAPLUS COPYRIGHT 2004 ACS on STN
 AB The title agent contains polymers of polyamic acids and of imide derived from polyamic acids, wherein the polymer contains substituted or non-substituted biphenyl, naphthyl, phenanthrenyl, dibenzofuranyl, and anthracenyl groups, and has main chain of C28, C23 perfluoroalkyl, C26,1-cycloalkylene, or 23 ring of polycyclic group, -R-X-A group (R = C23 hydrocarbon; X = single bond, -O-, -CO-, etc.; A = halo, cyano, fluoroalkyl, etc.), or -R1-X1-R2-X2-R3 (R1-3 = C23 hydrocarbon, -(SiO)n-, n25; X1-2 = single bond, -O-, -CO-, etc.). The agent provides good liquid crystal alignment such as elimination of a ghost image of liquid crystal displays.

AB The polyamic acids and polyimides are manufactured by polymerization of

21

tetracarboxylic dianhydride, 21 aromatic diamine, 21 diamine having siloxane units RSiMe2(OSiMe2)nR (R = C1-20 alkylene; n = 1-20),

and

4-R-substituted cyclohexylidene dianiline and/or 3,3,5-trimethylcyclohexylidene dianiline (R = Me, Et, CMe3, CMe2CH2CH3, phenyl).

Thus, a solution of a polyamic acid prepared from oxydianiline, trimethylcyclohexylidene dianiline, bis(3-aminopropyl)tetramethyldisiloxane, and 3,3',4,4'-benzophenonetetracarboxylic acid dianhydride was applied on a glass plate, dried, and heated at 300° for 1 h to give a polyimide film with Tg 305°, modulus of elasticity 4900 N/mm2, and tensile strength 105.8 N/mm2. An adhesive tape, useful for electronic parts, etc., containing a polyimide prepared from the polyamic acid showed improved adhesion at high temp and good solubility in organic solvents.

L11 ANSWER 4 OF 14 CAPLUS COPYRIGHT 2004 ACS on STN

AB Polyamic acid are prepared by reacting a mixture containing: at least one tetracarboxylic dianhydride; at least one aromatic diamine; at least one diamine with a siloxane structure, and at least one alkyl or aryl cyclohexylidene dianiline. The polymers have such three-dimensional mol. structures that a significant improvement can be brought about in solvent solubility, thermal resistance, mech. properties, and adhesive properties onto

various substrates. The polyamic acid is converted into polyimide through

thermal or chemical imidization. The polyimide is suitable for use in adhesives or adhesive tapes for electronic parts.

AB The resins have a cardo-type polymer structure in which at least 0.1% of the H atoms of the pendant benzyl and/or allyl groups have been replaced by a halogen or contain a polymer in which at least 34% of the H atoms of the pendant benzyl and/or allyl groups have been replaced by a halogen. The resins not only have good solvent solubility, easiness of film

formation by a wet process, thermal stability, chemical stability, etc., but also have better performance with respect to gas permeability and gas selectivity, and are useful for gas separation membranes with good permeability and selectivity. Thus, mixing 9,9-bis(3',5'-dimethyl-4'-aminophenyl)fluorene 650 with 3,3',4,4'-biphenyltetracarboxylic dianhydride 468 in NMP 5500 g at room temperature for 1 h, heating the resulting solution at 180° for

7 h

while removing water, diluting the product with 18 L NMP, cooling, transferring into 100 L MeOH, washing the resulting precipitate with MeOH and drying gave a cardo-type polyimide which was then brominated using NBS (N-bromosuccinimide) and AIBN in dichloroethane to give a resin with bromination degree 27.6%. Dissolving 5 g this resin in 50 mL NMP, casting the resulting solution on a glass surface, drying at 50° for 10 h, detaching the cast film by dipping in water, drying at 50° in vacuo for 3 days, extracting the residual NMP with MeOH and drying again gave a membrane with CO₂ permeability 647x10⁻¹⁸ m³·m/(m²·s·P a) (86.2 bar) and N permeability 18.0x10⁻¹⁸ m³·m/(m²·s·cntdo t.Pa) (2.4 bar).

AB A review with 15 refs. is given on the authors preparation of diamine monomers

and polymers followed by data on solubility and phys. properties of the polyimides. A series of novel aromatic diamines containing kinked cycloalkane

structures between 2 Ph rings were synthesized by HCl-catalyzed condensation reaction of excess aniline and corresponding cycloalkanone derivs. The structures of the diamines were identified by ¹H NMR, ¹³C NMR, FT-IR spectroscopy, and elemental anal. The polyimides were synthesized from the obtained diamines with various aromatic dianhydrides by one-step polymerization in m-cresol. The polymerization was conducted for 6.apprx.8 h with refluxing, which was enough to obtain the polymers with high mol. weight

The inherent viscosities of the resulting polyimides were in the range of 0.37.apprx.1.66 dL/g. All polymers were readily soluble in common organic solvents such as chloroform, tetrachloroethane, dimethylacetamide, etc. and the glass transition temps. were observed at 290-372°. UV-visible spectra were obtained to measure the transparency of polymer films. Most of the polymers showed high transmission above 90% in the wavelength of 450.apprx.600 nm.

L11 ANSWER 7 OF 14 CAPLUS COPYRIGHT 2004 ACS on STN
AB We prepared photo-crosslinkable polyimide(PI) film, which contains CF3 moiety. The ketone peak (at 1678cm⁻¹) of PI was decreased and broad hydroxyl bond appeared. The decrease of ketone peak was also confirmed with UV-visible spectroscopy. The dichroic ratio of LC cell was obtained. The LC mols. are uniformly aligned perpendicular to polarization direction of irradiated light on PI layers. The pretilt angle of LC on alignment films was obtained to be about 3.3°.

AB The polyimides have repeating units I derived from aromatic tetracarboxylic dianhydrides and aromatic diamines (A1 = Q1, Q2; X = CO, O, none, C(CF3)2, O-1,3-C6H4O; A2 = 1,4-C6H4Z-1,4-C6H4, 1,4-C6H4, 1,3-C6H4, 1,3-C6H4O-1,4-C6H4SO2-1,4-C6H4O-1,3-C6H4; Z = Q3, O, CH2, O-1,4-C6H4SO2-1,4-C6H4O; R3 = (un)substituted C1-6 alkyl, (un)substituted Ph). The polyimides are manufactured by solution polymerization of (A) 2:1 aromatic tetracarboxylic dianhydrides selected from pyromellitic dianhydride, benzophenonetetracarboxylic dianhydride, oxydiphthalic dianhydride, biphenyltetracarboxylic dianhydride, hexafluoroisopropylidenediphthalic dianhydride, and hydroquinonebis(phthalic dianhydride) with (B) diamines containing H2N-1,4-C6H4Q3-1,4-C6H4NH2 and optionally oxydianiline, methylenedianiline, m-bis(aminophenoxy)diphenyl sulfone, and/or p-bis(aminophenoxy)diphenyl sulfone. Thus, 2.80 g 4-methylcyclohexylidenedianiline and 2.18 g pyromellitic dianhydride were polymerized at 70° for 2 h and then under refluxing for 6-12 h in dimethylacetamide containing isoquinoline to give a polyimide with intrinsic viscosity (0.5 g/dL in m-cresol) 1.18 dL/g, Tg 349°, thermal decomposition temperature 520°, and good solubility to various solvents.

L11 ANSWER 9 OF 14 CAPLUS COPYRIGHT 2004 ACS on STN
 AB Novel poly(amide imide)s (PAI) containing alkyl-substituted cyclohexylidene moieties were synthesized by conventional polycondensation of trimellitic anhydride chloride with novel aromatic diamines followed by chemical imidization using acetic anhydride and pyridine. The inherent viscosities of the resulting PAIs are relatively high and range from 71-112 mL g⁻¹. The prepared PAIs show excellent thermal stability and good solubility. The glass transition temps. (T_g) measured by DSC are observed in the range of 312-342°. Furthermore, all the polymers are readily soluble in less hygroscopic organic solvents like cyclohexanone, γ -butyrolactone as well as aprotic polar solvents.

L11 ANSWER 10 OF 14 CAPLUS COPYRIGHT 2004 ACS on STN
 AB A series of novel aromatic diamines containing kinked cyclohexylidene moieties was synthesized by a HCl-catalyzed condensation reaction of excess aniline and the corresponding alkyl-substituted cyclohexanone derivs. at 120-140° for 24 h. The structure of monomers was identified by 1H-NMR, 13C-NMR, and FT-IR, after preparation in yields of above 70%. Polyimides were synthesized from the obtained diamines and various aromatic dianhydrides by one-step polymerization in m-cresol at 200° for 6-8 h. The inherent viscosity of the soluble polyimides was 0.74-1.66 dL/g and the polyimides showed excellent thermal stability; all polymers were readily soluble in common organic solvents such as dimethylacetamide, DMF, THF, chloroform, etc. and the glass transition temperature is 261-348°. The solubility and the glass transition temperature of the polymers increased as the bulkiness of the alkyl-substituents increased.

L11 ANSWER 11 OF 14 CAPLUS COPYRIGHT 2004 ACS on STN
 AB A series of 3 aromatic diamines containing kinked cyclohexylidene moieties was synthesized by condensation of excess PhNH₂ with cyclohexanones containing 0, 1, or 3 Me groups. The structures of the cyclohexylidenedianilines were identified by ¹H NMR, ¹³C NMR, and FT-IR spectroscopies. Polyimides were synthesized from the obtained diamines and various aromatic dianhydrides by

the conventional polycondensation reaction followed by chemical imidization as well as high-temperature one-step polymerization. The inherent viscosities and weight-average mol. wts. of the polyimides were in the ranges of 0.55-1.58 dL/g and (7.4-15.2) × 10⁴ g/mol, resp. The prepared polyimides showed excellent thermal stabilities and good solubility. All polymers were readily soluble in common organic solvents such as THF, chloroform, tetrachloroethane, etc., and the glass transition temps. were observed at 290-372°.

AB The diamines I (R1, R2 = H, Cl, Br, alkyl, cycloalkyl, aryl, aralkyl; R3, R4 = H, alkyl (but ≥ 1 C atom must bear 2 alkyl groups); m = 4-7), useful in polymerization, are prepared. Thus, HCl-catalyzed condensation of 11: sol dihydroisophorone with 66 mol PhNH2 at 140° gave 1045 g 4,4'-(3,3,5-trimethylcyclohexylidene)dianiline (II). Mixing 7.7 g II in DMF with a DMF solution of prepolymer from 600 g polypropylene glycol (OH number 112) and 268 g IPDI, casting the solution on glass, and drying at 100-150° gave a film with softening point (DSC) 206°.

CN Benzenamine, 4,4'-[4-(1,1-dimethylethyl)cyclohexylidene]bis- (9CI) (CA INDEX NAME)				

GI For diagram(s), see printed CA Issue.

AB Azo dyes for use as purple components in the Ag dye-bleach process have the general structure I, where A is H, an alkyl or alkoxy group, or halogen, Z is 5 (or 6)-SO₃H, Y is CO or SO₂, X is an alkyl or aryl group (the aryl group possibly is substituted by an alkyl and/or halogenated alkyl group or by halogens), R' is H, alkyl, cycloalkyl, or the group C(Q)Z, where Q is H or an alkyl group, and R is 1,1,4-cyclohexanetriyl. For example, 22 g.

4-tert-butyl-1,1-bis(4-amino-3-methylphenyl)cyclohexane (II) (from o-toluidine and 4-tert-butylcyclohexanone) in a mixture of 150 ml. MeOCH₂CH₂OH, 50 ml. concentrated HCl, and 50 g. ice is tetrazotized

and coupled with 100.8 g. 8-(2,5-dimethyl-4-chlorobenzenesulfonamido)-1-naphthol-3,6-disulfonic acid (III) in 600 ml. H₂O and 180 ml. pyridine, and the dye (IV) [I, R' is Me₃C, A is Me, Z is 6-SO₃H, Y is SO₂, and X is 2,5,4-Me₂(Cl)C₆H₂] is salted out. Similarly, the 4-amino-3-ethylphenyl analog of II is tetrazotized and coupled with the 2,5-dichlorobenzenesulfonamido analog of III; and 4-isopropylidene-1,1-bis(4-amino-3-ethylphenyl)cyclohexane is tetrazotized and coupled with the 4-methylbenzenesulfonamido analog of III to give dyes. IV (3.5 g.) is dissolved in 600 ml. H₂O with 1 g. saponin and then mixed with a green-sensitized AgBr-gelatin emulsion containing about 35 g. Ag/kg.; the mixture is poured onto a paper or film carrier and dried. The exposed

film is processed by developing for 5 min. in a standard Metol-hydroquinone developer solution; rinsed for 1 min.; fixed for 5 min. in a solution of

20% Na₂S₂O₃ and 2% Na₂S₂O₅; rinsed for 5 min.; hardened for 5 min. in 4% HCHO; rinsed for 5 min.; color-bleached for 10 min. in a solution of 200 ml.

10% KI, 10 g. NaH₂PO₂, 90 ml. quinoline, 300 ml. 5N HCl, and 400 ml. H₂O; rinsed for 5 min.; Ag-bleached for 5 min. with a solution containing 80

g. K₃Fe(CN)₆, 10 g. NaHCO₃, and 1000 ml. H₂O; rinsed for 5 min.; fixed for 5 min.; rinsed for 20 min., and dried to give a purple positive image. Cf. CA 55, 8136d.

L15 ANSWER 1 OF 7 CAPLUS COPYRIGHT 2004 ACS on STN
 AB The polyamic acids and polyimides are manufactured by polymerization of

21 tetracarboxylic dianhydride, 21 aromatic diamine, 21 diamine having siloxane units $\text{RSiMe}_2(\text{OSiMe}_2)_n\text{R}$ ($\text{R} = \text{C}_1\text{-20 alkylene}$; $n = 1\text{-20}$), and

4-R-substituted cyclohexylidene dianiline and/or 3,3,5-trimethylcyclohexylidene dianiline ($\text{R} = \text{Me}$, Et , CMe_3 , $\text{CMe}_2\text{CH}_2\text{CH}_3$, phenyl).

Thus, a solution of a polyamic acid prepared from oxydianiline, trimethylcyclohexylidene dianiline, bis(3-aminopropyl)tetramethyldisiloxane, and 3,3',4,4'-benzophenonetetracarboxylic acid dianhydride was applied on a glass plate, dried, and heated at 300° for 1 h to give a polyimide film with T_g 305° , modulus of elasticity 4900 N/mm^2 , and tensile strength 105.8 N/mm^2 . An adhesive tape, useful for electronic parts, etc., containing a polyimide prepared from the polyamic acid showed

improved adhesion at high temp and good solubility in organic solvents.

L15 ANSWER 2 OF 7 CAPLUS COPYRIGHT 2004 ACS on STN
AB Polyamic acid are prepared by reacting a mixture containing: at least one tetracarboxylic dianhydride; at least one aromatic diamine; at least one diamine with a siloxane structure, and at least one alkyl or aryl cyclohexylidene dianiline. The polymers have such three-dimensional mol. structures that a significant improvement can be brought about in solvent solubility, thermal resistance, mech. properties, and adhesive properties onto various substrates. The polyamic acid is converted into polyimide through thermal or chemical imidization. The polyimide is suitable for use in adhesives or adhesive tapes for electronic parts.

 AB A review with 15 refs. is given on the authors preparation of diamine monomers and polymers followed by data on solubility and phys. properties of the polyimides. A series of novel aromatic diamines containing kinked cycloalkane structures between 2 Ph rings were synthesized by HCl-catalyzed condensation reaction of excess aniline and corresponding cycloalkanone deriva. The structures of the diamines were identified by ¹H NMR, ¹³C NMR, FT-IR spectroscopy, and elemental anal. The polyimides were synthesized from the obtained diamines with various aromatic dianhydrides by one-step polymerization in m-cresol. The polymerization was conducted for 6.apprx.8 h with refluxing, which was enough to obtain the polymers with high mol. weight. The inherent viscosities of the resulting polyimides were in the range of 0.37.apprx.1.66 dL/g. All polymers were readily soluble in common organic solvents such as chloroform, tetrachloroethane, dimethylacetamide, etc. and the glass transition temps. were observed at 290-372°. UV-visible spectra were obtained to measure the transparency of polymer films. Most of the polymers showed high transmission above 90% in the wavelength of 450.apprx.600 nm.

 AB Novel poly(amide imide)s (PAI) containing alkyl-substituted cyclohexylidene moieties were synthesized by conventional polycondensation of trimellitic anhydride chloride with novel aromatic diamines followed by chemical imidization using acetic anhydride and pyridine. The inherent viscosities of the resulting PAIs are relatively high and range from 71-112 mL g⁻¹. The prepared PAIs show excellent thermal stability and good solubility. The glass transition temps. (T_g) measured by DSC are observed in the range of 312-342°. Furthermore, all the polymers are readily soluble in less hygroscopic organic solvents like cyclohexanone, γ -butyrolactone as well as aprotic polar solvents.

 AB A series of 3 aromatic diamines containing kinked cyclohexylidene moieties was synthesized by condensation of excess PhNH₂ with cyclohexanones containing 0, 1, or 3 Me groups. The structures of the cyclohexylidenedianilines were identified by ¹H NMR, ¹³C NMR, and FT-IR spectroscopies. Polyimides were synthesized from the obtained diamines and various aromatic dianhydrides

by the conventional polycondensation reaction followed by chemical imidization as well as high-temperature one-step polymerization. The inherent viscosities and weight-average mol. wts. of the polyimides were in the ranges of 0.55-1.58 dL/g and (7.4-15.2) × 10⁴ g/mol, resp. The prepared polyimides showed excellent thermal stabilities and good solubility. All polymers were readily soluble in common organic solvents such as THF, chloroform, tetrachloroethane, etc., and the glass transition temps. were observed at 290-372°.

GI For diagram(s), see printed CA Issue.
AB The diamines I (R1, R2 = H, Cl, Br, alkyl, cycloalkyl, aryl, aralkyl; R3, R4 = H, alkyl (but 21 C atom must bear 2 alkyl groups); m = 4-7), useful in polymerization, are prepared. Thus, HCl-catalyzed condensation

of 11 mol dihydroisophorone with 66 mol PhNH2 at 140° gave 1045 g 4,4'-(3,3,5-trimethylcyclohexylidene)dianiline (II). Mixing 7.7 g II in DMF with a DMF solution of prepolymer from 600 g polypropylene glycol

(OH number 112) and 268 g IPDI, casting the solution on glass, and drying at 100-150° gave a film with softening point (DSC) 206°.
